A LOOK AT THE FUTURE (OF ONLINE LEARNING?)

Alyssa A. Goodman

Harvard-Smithsonian Center for Astrophysics & Radcliffe Institute for Advanced Study

@aagie, @PredictionX

1965: "Moore's Law" Predicts the Future of Integrated Circuits

Fairchild's Director of R & D predicts the rate of increase of transistor density on an integrated circuit and establishes a yardstick for technology progress.

Gordon Moore, Fairchild Semiconductor's Director of R&D, wrote an internal paper in which he drew a line through five points representing the number of components per integrated circuit for minimum cost per component developed between 1959 and 1964. "The Future of Integrated Electronics" attempted to predict "the development of integrated electronics for perhaps the next ten years." Extrapolating the trend to 1975 he projected that the number of components per chip would reach 65,000; a doubling every 12 months. Edited for publication as a magazine article, "Cramming more components onto integrated circuits" was published in Electronics on April 19, 1965.

At the 1975 IEEE International Electron Devices Meeting Moore, by now with Intel, noted that advances in photolithography, wafer size, process technology, and "circuit and device cleverness," especially in semiconductor memory arrays, had allowed his projection to be realized. Adding more recent data, that included a higher mix of microprocessor designs that were somewhat less dense than memories, he slowed the future rate of increase in complexity to "a doubling every two years, rather than every year."

John Snow Society mag.
 ROSALIND: Yes.
 So he had, if you like, he'd got the data.
 And this was just another way of demonstrating it.
 It wasn't how he solved the outbreak.
 DON: When I talk to my students about this, I always ask them, **so did John Snow perform a case control study,** which is fundamental in epidemiology.
 It's the greatest tool for working up outbreaks that we have.
 In a case control study, you study the exposure of the cases, in this case, water pumps, and the exposure of the controls, the people who were

September 12, 2016 Hide

PredictionX: John Snow and the Cholera Outbreak of 1854

John Snow and the Cholera Outbreak of 1854 offers a preview of a new HarvardX offering called "PredictionX," which looks at how humans have predicted their own futures throughout recorded time. Here, we explore how a deadly outbreak of cholera in London, and John Snow's investigation of its cause, gave rise to the modern field of epidemiology. It's a fascinating story. Even if you've heard it before, you may find new facts and details here that we've uncovered through expert interviews and map analysis. We hope you enjoy it.

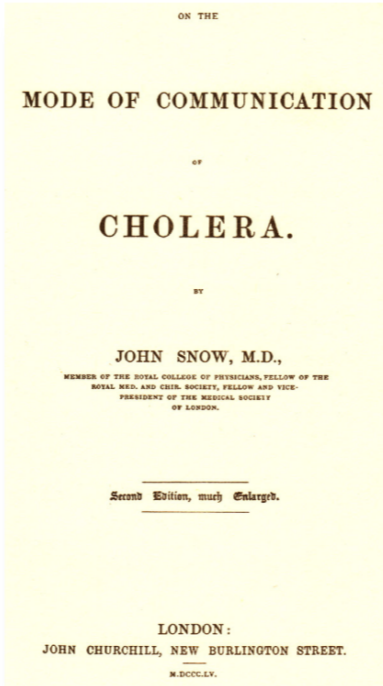

The full set of *PredctionX* offerings, to be released on edX in installments during 2016 and 2017, will begin with the story of how preists in Ancient Mesopotamia used sheep entrails to foretell the future, and will end by explaining how modern-day scientists use computers to predict the future of our world's climate, economy, health, and place in the Universe. For more information, check out [the sneak peek of the rest of PredictionX](#) at the end of this course and stay tuned for updates at #PredictionX on twitter, and here on edX. Twenty-five faculty are working together to create this course, from across Harvard, and beyond.

You can click on the icons in the bar above to jump to the different parts of this course. Once you are in the course, you will can navigate to course material using the vertical menu that is standard in all edX courses.

Harvard University

From Wikipedia, the free encyclopedia

Coordinates: 42°22′28″N 71°07′01″W﻿ / ﻿

"*Harvard*" redirects here. For other uses, see *Harvard (disambiguation)*.

Harvard University is a private Ivy League research university in Cambridge, Massachusetts, established in 1636, whose history, influence, and wealth have made it one of the world's most prestigious universities.^[7]

Established originally by the Massachusetts legislature and soon thereafter named for John Harvard (its first benefactor), Harvard is the United States' oldest institution of higher learning,^[8] and the Harvard Corporation (formally, the *President and Fellows of Harvard College*) is its first chartered corporation. Although never formally affiliated with any denomination, the early College primarily trained Congregationalist and Unitarian clergy. Its curriculum and student body were gradually secularized during the 18th century, and by the 19th century Harvard had emerged as the central cultural establishment among Boston elites.^{[9][10]} Following the American Civil War, President Charles W. Eliot's long tenure (1869–1909) transformed the college and affiliated professional schools into a modern research university; Harvard was a founding member of the Association of American Universities in 1900.^[11] James Bryant Conant led the university through the Great Depression and World War II and began to reform the curriculum and liberalize admissions after the war. The undergraduate college became coeducational after its 1977 merger with Radcliffe College.

The university is organized into eleven separate academic units—ten faculties and the Radcliffe Institute for Advanced Study—with campuses throughout the Boston metropolitan area.^[12] its 209-acre (85 ha) main campus is centered on Harvard Yard in Cambridge, approximately 3 miles (5 km) northwest of Boston; the business school

Description

How To: Egyptian Divination

How to seek a prediction: Seek out a priest, or wait for one to arrive, likely by boat

(Sample) Equipment: special statue, possibly with a movable head for "nodding"

Personnel: Priest trained in decreeing oracles

Oracles appear relatively late in the long span of Egyptian history. The first representations of a sacred boat containing an oracular statue of the god Amun date to the early New Kingdom (reign of Amenhotep I, around 1525 BCE). While there are some earlier textual references, neither the Old Kingdom (Pyramid Age, around 2686–2181 BCE), nor the Middle Kingdom (age of great Egyptian literature, around 2055–1650 BCE), seem to place much reliance on decrees from oracles. It is the New Kingdom, and the following Third Intermediate Period (about 1069–664 BCE) and Late Period (about 664–332 BCE) where we find the most frequent mention of oracular decisions, both royal and "private."

There was no single god responsible for all oracular decrees. The Egyptians appealed to many forms of the god Amun, Amun-Re, and other deities, state and local; even the deified king Amenhotep I was consulted by many residents of Thebes. Throughout Egyptian history we see an ebb-and-flow in perceptions of the divine nature of the pharaoh. At times the populace relied upon the king and the pharaonic court system, at other times direct appeals to the god(s) for assistance were far more common. Methods included approaching the statue of the god, borne in his sacred bark upon the shoulders of priests, during festival processions. Or, people could submit "yay or nay" inscriptions to the deity for a

Our Need to Know

Human beings have an inherent curiosity about the future. We want to know what's going to happen to us. In our attempt to predict the future, we can drive us to learn more about our universe, but it can also leave us open to manipulation by others. When you see the Crystal Ball Mind icon, nearby material will illuminate humanity's fascination with the future and the way in which we react to predictions.

Key Questions:

- Where does our desire to know the future come from?
- How do we react to predictions?

Cognitive Biases

Sometimes the incredible, complex human mind can make equally complex errors. We pay attention to irrelevant details; we see patterns where they don't exist; we even reject information that contradicts our beliefs. Cognitive biases are the ways in which our mental shortcuts and heuristics get in our way. When you see the Tipped Scales icon, nearby material will point out the thought patterns that lead us to less accurate predictions, including over-generalization, confirmation bias, illusions of control, and the gambler's fallacy.

Key Questions:

- When does human nature get in the way of making an accurate prediction or recognizing a bad one?
- How has bias shaped our predictions and our response to them?

Subjective Analysis

To be widely accepted, predictions must be more than accurate – they must be appealing. Human beings judge predictions on more than just an objective basis. We apply skepticism, question believability, and look for the utility value in the things we hear. When you see the Heart-and-Mind icon, nearby material will speak to our emotional evaluation of predictions and the things that human beings choose to value.

Key Questions:

- How do human beings choose what predictions to value?
- What determines how strongly we act on a prediction?

Objective Analysis

When you see the Microscope icon, nearby material will delve into objective measurements of a prediction's accuracy, such as reliability, convergence, and quantified uncertainty.

Key Questions:

- How do we quantify a prediction or theory?
- How do we measure uncertainty?

The Observation/Theory Cycle

The Cycle icon refers to humans' unceasing endeavor to create theories that explain the patterns they observe around them. Sometimes individuals who create the theories also seek to test them, but other times, they love their theories so much that they leave the testing to future generations.

Key Question:

- How do human beings formalize the patterns that we see in our observations?

Who's Making the Prediction?

Every culture agrees that predictions are best made by experts. However, different traditions disagree on what makes one an expert. Some prognosticators are highly trained, while others are chosen (or cursed) by the gods. Many traditions require both divine blessing and worldly preparation. When you see the Yin-Yang icon, nearby material will explore prediction as an intuitive or teachable process, and investigate the nature of both diviners and those who interpret their predictions.

Key Questions:

- Why are certain individuals uniquely qualified to make certain predictions?

The Hidden Nature of our Universe

Every prediction is made in context. Whether this context is our planet's climate, an economic market, the orbits of comets, or our own social networks, the rules of these systems are at the heart of our ability to understand them. The nature of our universe is at the very heart of prediction. When you see the "cracked eye" icon, nearby material will deal with concepts such as free will, determinism, and probability; natural or supernatural laws; the invisible hand of the market; and the root source of uncertainty.

Key Questions:

- What properties of our universe make it possible to predict the future?
- What makes it difficult to predict the future?
